

ABSTRACT

A transverse suspension device for ACL graft fixation in a femoral tunnel comprising a body section and a smooth head section forming the leading end of the device, the body and smooth head sections each being cannulated along the entire lengths thereof; the head section comprising a recess-engaging section extending proximally from the distal end thereof and operable to engage with a recess formed in the bone tunnel, and a graft loop support section between the recess-engaging section and the body section adapted to stably support the graft loop thereover.
